Re: First Quarter 2001 Surface and Subsurface Water Monitoring Report
ECC Superfund Site
Zionsville, Indiana

Dear Mr. McAteer:

This report summarizes the monitoring of the till wells, the sand/gravel wells, and the surface water of the Unnamed Ditch at the ECC Superfund Site in Zionsville, Indiana during the first quarter of 2001.

The specific tasks completed during the first quarter of 2001 included:

- Collection of water level measurements from 16 monitoring wells on January 29, 2001;
- Sampling of the 6 off-site till monitoring wells and the 5 off-site sand/gravel monitoring wells, including ECC MW-13, during the week of January 29, 2001;
- Sampling of the 4 on-site till monitoring wells from January 29, 2001 to February 12, 2001;
- Sampling of 2 surface water locations within Unnamed Ditch during the week of January 29, 2001;
- Analysis of all the surface and subsurface water samples collected for the parameters specified in the Revised Remedial Action, Exhibit A, Revision 2, dated May 7, 1997 (Revised Exhibit A);

The following section provides a brief description of the first quarter sampling activities. The first quarter water level measurements, analytical results for the surface and subsurface water samples, and the field measurements and purge data are summarized in the attached tables.

650 Dundee Road, Suite 150 • Northbrook, Illinois 60062 • USA • Tel: (847) 753-9900 • Fax: (847) 753-9420 • www.environcorp.com

A. Subsurface Water Flow Determination

1. Data Collection

On January 29, 2001, the depth to water was measured in four on-site till monitoring wells, six off-site till monitoring wells, one off-site piezometer, and five off-site sand/gravel monitoring wells using an electronic water level meter.

The till and sand/gravel monitoring well locations are shown on Figure 1. Measurements were recorded to the nearest 0.01 foot. The depth to water measurements and the corresponding water elevation data derived from these measurements are presented in Table 1.

2. Subsurface Water Elevation Data

Subsurface water elevations and contours for the sand/gravel unit at the site, for the first quarter 2001, are presented in Figure 2.

B. On-Site and Off-Site Subsurface Water Sampling

Subsurface water samples (including duplicates) were collected from on-site till monitoring wells T-1, T-3 and T-4A, off-site monitoring wells T-5 through T-10, off-site sand/gravel monitoring wells S-1 through S-4A, and ECC MW13 between January 29, 2001 and February 1, 2001. Subsurface water samples were collected between January 30, 2001 and February 12, 2001 from on-site till monitoring well T-2A, due to the slow recoveryof T-2A. The on-site subsurface water sample results are summarized in Table 2. The subsurface water sample results for the off-site till and off-site sand/gravel monitoring wells are summarized in Table 3 and Table 4, respectively.

All samples were collected as described in Section 6.3 of the Radian Revised Remedial Action Field Sampling Plan (FSP), Revision 4, dated April 28, 1998, with modifications outlined in the *Low Flow Ground Water Sampling* proposal dated November 10, 2000. In accordance with the FSP, the wells were purged a minimum of three well volumes or until the wells went dry, prior to sampling. Low-flow sampling techniques were incorporated into the sampling procedure to decrease the turbidity of the samples collected and to reduce the number of wells that purged dry before three well volumes could be removed. The subsurface water in the on-site till monitoring wells was evacuated and sampled using dedicated PVC bladder-pumps and Teflon-lined polyethylene tubing. A disposable Teflon- bailer was also used to assist in the collection of subsurface water samples from on-site till monitoring well T-2A, due to poor recovery. The subsurface water in the off-site monitoring wells was evacuated and sampled using a peristaltic pump and dedicated Teflon-lined polyethylene tubing. The intake for the dedicated tubing was placed at the bottom of the screened interval. Due to the poor recovery in till monitoring wells (T-5 and T-8), the samples from these wells were collected over a period of 1 to 4 days. Volatile organic compounds (VOCs) and hexavalent chromium samples were collected as soon as possible on the day of purging the wells.

The metals and polychlorinated biphenyls (PCBs) samples were filtered using 0.45-micron filters in accordance with Section 6.3 of the FSP. Field measurements of pH, temperature, specific conductivity, and dissolved oxygen were collected before, during, and after the purging procedure. Field indicator parameters and other information recorded during well purging and sampling are provided in Tables A-1 through A-3 of Appendix A.

C. Surface Water Sampling

Surface water samples were collected from two locations within Unnamed Ditch (SW-1 and SW-2) during the First Quarter sampling event. Samples were not collected from the NSL-1 location since water was not flowing from the North Side Landfill discharge to the Unnamed Ditch during the sampling event. The surface water samples were collected as described in Section 6.3 of the FSP. Surface water sample locations are shown on Figure 1. The surface water sample results are summarized in Table 5.

Field measurements of pH, temperature, specific conductivity, and dissolved oxygen were collected from a sample of the water collected at each surface water sampling location. Field indicator parameters as well as the rain accumulation measurements recorded for the 24-hour and 48-hour period prior to sampling are provided in Table A-4 of Appendix A.

D. Sample Analysis and Results

Following sample collection, the samples were placed in ice-filled coolers and shipped via an overnight courier to CompuChem Laboratories (CompuChem) of Cary, North Carolina, for analysis. Appropriate chain-of-custody protocols were followed throughout sample handling.

Subsurface and surface water samples were analyzed for the parameters listed in Table 3-1 of Revised Exhibit A in accordance with the analytical methods summarized in Table 7-1 of the FSP. Analytical results for the surface, subsurface and the quality assurance and quality control samples for this sampling event are summarized in Table 2 through Table 6. In addition, all quarterly monitoring analytical data to date are presented by location in Appendix B.

E. Quality Assurance and Quality Control Procedures

To monitor the effectiveness of sampling procedures, ENVIRON collected field blanks by pumping laboratory supplied deionized water through the peristaltic pump and tubing into a sample container. For the metals and PCB samples, the deionized water was also passed through a 0.45-micron filter. Two field blanks were collected and analyzed this quarter. Three trip blanks were submitted to the laboratory to monitor for possible contamination during sample handling, transport, and storage. The trip blanks accompanied the samples and were analyzed for the VOCs listed in Table 3-1 of Revised

Exhibit A. The trip and field blank sample results were compared to the most stringent of the Acceptable Stream Concentrations and the Acceptable Subsurface Water Concentrations for each analyte. The trip and field blank sample results are presented in Table 6.

Methylene chloride was detected at low concentrations in all three trip blanks and one of the field blanks for this sampling event. Low concentrations (below the contract required detection limit) of toluene were also reported for two of the three trip blanks and both field blanks. Methylene chloride and toluene were not detected in CompuChem's laboratory method blanks. However, methylene chloride was reported at a similar concentration in the monitoring well associated with one of the field blanks. The trip blanks and the deionized water, used for the collection of the field blanks, was prepared by CompuChem for this sampling event. ENVIRON believes that the methylene chloride and toluene concentrations detected within the trip blanks, field blanks, and the associated monitoring well are the result of laboratory contamination.

Bis (2-ehtylhexyl) phthalate was detected at a low concentration in one of the field blanks. A similar concentration of bis (2-ehtylhexyl) phthalate was detected in CompuChem's laboratory method blank. Tetrachloroethene was also detected at low concentrations in one field blank and the associated laboratory method blank. Based on their presence in the laboratory method blank, ENVIRON believes that the concentrations of tetrachloroethene and bis (2-ehtylhexyl) phthalate are the result of laboratory contamination.

Low concentrations of manganese (0.92 µg/L and 0.77 µg/L) were reported in both field blank samples. Manganese concentrations were reported below the contract required detection limit. The source of the manganese detected in the field blank samples could not be determined.

To evaluate the reproducibility of results, ENVIRON collected one duplicate subsurface water sample from the off-site sand/gravel monitoring well S-1 and the off-site till monitoring well T-9. The duplicate samples were collected by pumping the subsurface water from the monitoring wells into two sets of sample containers. The results of the duplicate samples are presented in Table 4 and Table 3, respectively. The results for the duplicate pairs were similar, indicating good reproducibility of the sampling and analytical methods. In addition to the duplicate samples, ENVIRON collected additional sample volume from the surface water sampling point SW-2 for the laboratory matrix spike and matrix spike duplicate (MS/MSD) samples.

If you have any questions about this letter or any other aspects of the project, please do not hesitate to contact us.

Sincerely,

ENVIRON International Corporation

Notes:

All concentrations are in ug/L.

Concentrations in bold exceed the Revised Site Specific Acceptable Subsurface Water Concentrations as presented in the December 22, 2000 Background Report.

[2] = Revised Site-Specific Acceptable Subsurface Concentrations as determined in the Background Surface and Subsurface Water Monitoring Report dated December 22, 2000, Table 6 values.

NA* = Sample was not analyzed due to laboratory error.

U = Analyte not detected. The value shown is the associated detection limit.

B = Analyte was also detected in the laboratory method blank (organic) or analyte value is <contract required detection limit but > = instrument detection limit (inorganic).

D = Sample quantitated on a diluted sample.

J = Estimated value.

Notes:

All concentrations are in ug/L.
Concentrations in bold exceed the Revised Site Specific Acceptable Stream Water Concentrations as presented in the December 22, 2000 Background Report.

[2] = Revised Site-Specific Acceptable Stream Concentrations as determined in the Background Surface and Subsurface Water Monitoring Report dated December 22, 2000, Table 6 values. USEPA Contract Laboratory Program method detection limits for PCBs and arsenic were used in place of the Acceptable Stream Concentrations for these analytes since the detection limits are above their respective Table 3-1 values.

U = Analyte not detected. The value shown is the associated detection limit.

B = Analyte was also detected in the laboratory method blank (organic) or analyte value is < contract required detection limit but > = instrument detection limit (inorganic).

J = Estimated Value.

D = Compound quantitated on a diluted sample.

P = Indicates a 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported.

Notes:

All concentrations are in ug/L.
Concentrations in bold exceed the Revised Site Specific Acceptable Stream Water Concentrations as presented in the December 22, 2000 Background Report.

[2] = Revised Site-Specific Acceptable Stream Concentrations as determined in the Background Surface and Subsurface Water Monitoring Report dated December 22, 2000, Table 6 values.
USEPA Contract Laboratory Program method detection limits for PCBs and arsenic were used in place of the Acceptable Stream Concentrations for these analytes since the detection limits are above their respective Table 3-1 values.

U = Analyte not detected. The value shown is the associated detection limit.

B = Analyte was also detected in the laboratory method blank (organic) or analyte value is < contract required detection limit but > = instrument detection limit (inorganic).

J = Estimated Value.

D = Compound quantitated on a diluted sample.

Notes:

All concentrations are in ug/L.
Concentrations in bold exceed the Revised Site Specific Acceptable Stream Water Concentrations as presented in the December 22, 2000 Background Report.

[2] = Revised Site-Specific Acceptable Stream Concentrations as determined in the Background Surface and Subsurface Water Monitoring Report dated December 22, 2000, Table 6 values.
USEPA Contract Laboratory Program method detection limits for PCBs and arsenic were used in place of the Acceptable Stream Concentrations for these analytes since the detection limits are above their respective Table 3-1 values.

U = Analyte not detected. The value shown is the associated detection limit.

B = Analyte was also detected in the laboratory method blank (organic) or analyte value is <contract required detection limit but > = instrument detection limit (inorganic).

J = Estimated Value.

1 U/0.8 U = Sample result/Duplicate sample result.

D = Compound quantitated on a diluted sample.

E = Exceeds the upper limit of the calibration range of the instrument for that specific analysis.
